

**REGIONAL PLANNING AND FLOOD
 MODELING FOR RESILIENCE AND
 ENVIRONMENTAL IMPROVEMENT**
 Presented by:
 Katherine Daly, PE, CFM

What is Resilient NJ?

RESILIENT

New Jersey was awarded \$10 million from HUD through the National Disaster Resilience competition.

The Resilient NJ program provides funding and technical assistance to multi-municipal regions within New Jersey's nine Most Impacted and Distressed counties affected by Superstorm Sandy to undertake a comprehensive planning process.

Planning Regions

Jersey City, Bayonne, Hoboken, & Newark

Long Beach Township, Barnegat Light, Beach Haven, Harvey Cedars, Ship Bottom, & Surf City

Middlesex County, Perth Amboy, Woodbridge, Sayreville, South River, & Old Bridge

Ventnor, Brigantine, Atlantic City, Margate, Longport, Northfield, & Pleasantville

RESILIENT NJ IS NOW INCLUDED AS A TOOL WITHIN
THE U.S. CLIMATE RESILIENCE TOOLKIT

United States
Global Change
Research Program

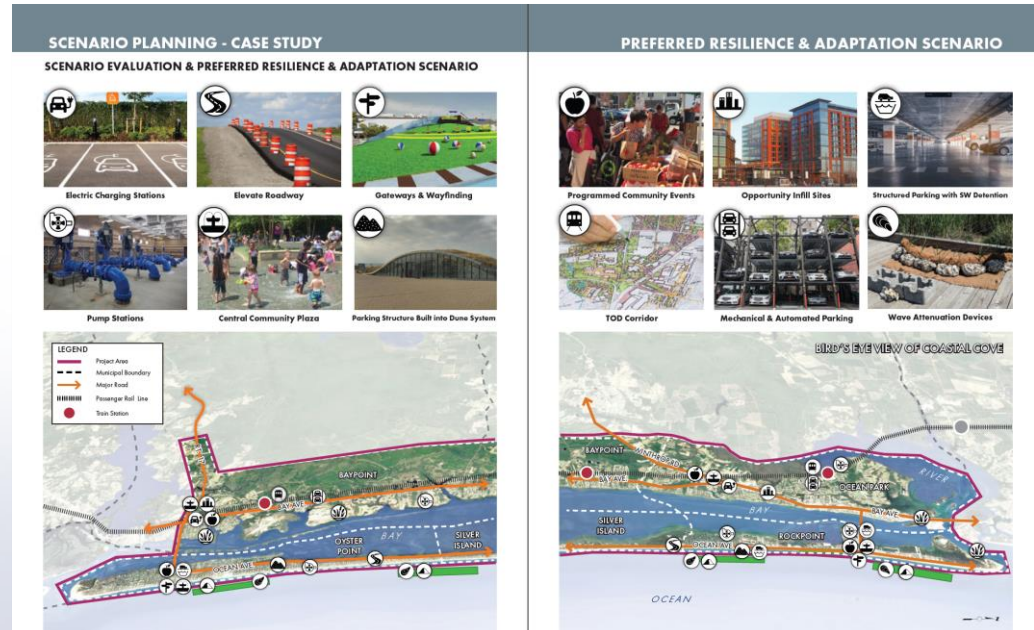

Vulnerability Assessment and Scenario Planning

- Assessing Vulnerability
- Future Flooding Hazards
- Developing Scenarios
- Developing Actions
- Innovative Solutions with Multiple Benefits
- Evaluating Scenarios

Resilience Indicators:

- Alignment with Vision
- Risk Reduction
- Cost Efficiency
- Regional Capacity
- Environmental Enhancement
- Adaptability Over Time
- Community Support
- Social, Cultural, and Economic Enhancement

Climate Change Resilience Strategy

NEW JERSEY'S SIX CLIMATE RESILIENCE PRIORITIES

- Build Resilient and Healthy Communities
- Strengthen the Resilience of New Jersey's Ecosystems
- Promote Coordinated Governance
- Invest in Information and Increase Public Understanding
- Promote Climate-Informed Investments and Innovative Financing
- Coastal Resilience Plan

For a copy of the Strategy Visit:
<https://www.nj.gov/dep/climatechange/resilience-strategy.html>

For a copy of the Scientific Report Visit:

 FOR ENVIRONMENTAL PROTECTION

NATIONAL CONFERENCE OF STATE LEGISLATURES

Modeled Regions

- Models based on readily available data
- 2-dimensional HUC-8 watershed level analysis originally intended for regional resilience planning
- Utilize HEC-HMS and HEC-RAS 5.0.7
- Built framework to be highly adaptable
 - Easily changed inputs for regional specific needs
 - Refinements possible for engineering level analysis

Process Overview – 2D Rain on Grid

- Utilized available LiDAR data
- For Resilient NJ:
 - Hydrologically conditioned DEM using Arc Hydro Toolkit

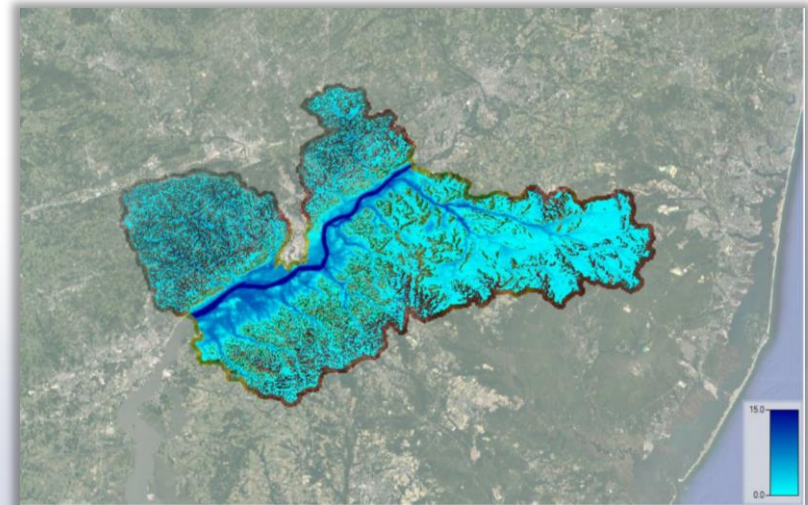

- SCS Type III rainfall distribution and precipitation depths derived from NOAA Atlas 14 rainfall data.
- Curve numbers (CN) developed based on the NJDEP 2015 Land Use/Land Cover layer.
- Determine excess precipitation hyetographs for the region.

Mesh Creation and Hydraulics

- Model mesh created using a nominal cell size of 200' x 200'
- Existing Manning's N_s values (based on 2015 NJDEP land use/land cover data) used.
- A Courant-based adjustable time-step was used.

Apply Rainfall and Boundary Condition Data

Flooding Condition	Type
Current	a. MHHW + 2% annual chance, 2-hour storm event
	a. MHHW + 1% annual chance, 24-hour storm event
Future	a. MHHW + SLR 2070 (2.4 ft)
	a. MHHW + SLR 2070 (2.4 ft) + (2% annual chance, 2-hour storm event + 10% increase in rainfall)
	a. MHHW + SLR 2070 (2.4 ft) + (1% annual chance, 24-hour storm event + 10% increase in rainfall)
	a. MHHW + SLR 2070 (2.4 ft) + Superstorm Sandy in 2070 (High Water Mark = 8.3 ft)

Mapping Output

- Produce water surface elevation output and depth grids for loss assessments
- Floodplain outputs reviewed for disconnected floodplain polygons and general smoothing.

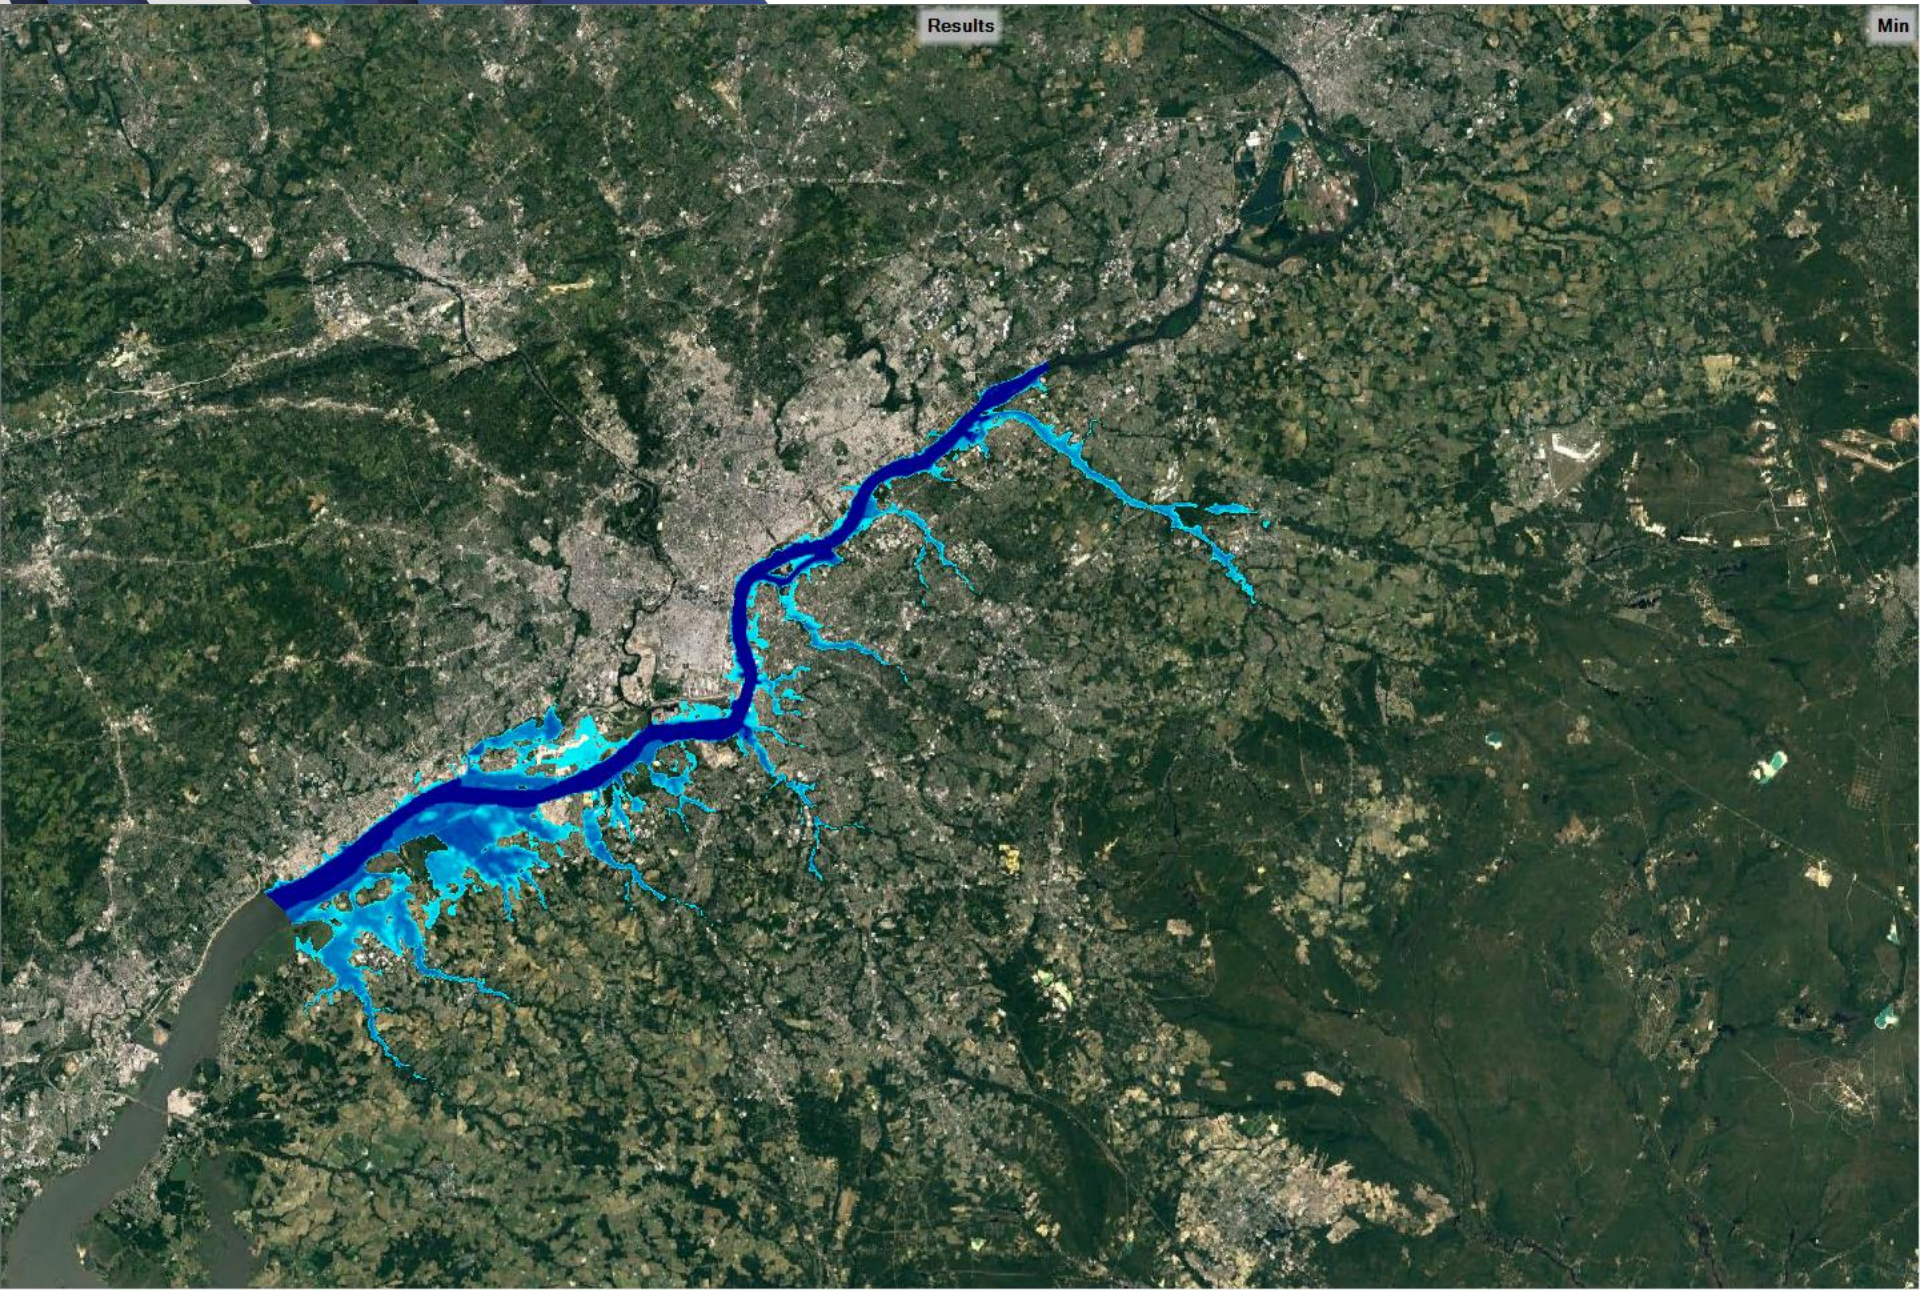

Calibration/Validation

- Gage data used for calibration and validation of discharges.
- Flood extents closely match FEMA SFHAs when modeling present day, 100-year event.

Inputs easily adaptable for resiliency or other project needs

- Utilizing these methods for:
 - NJDOT
 - Camden County, NJ
 - Columbia Association, Maryland
- Inputs related to climate change:
 - Projected increases in precipitation
 - Sea Level Rise
 - Surge Events

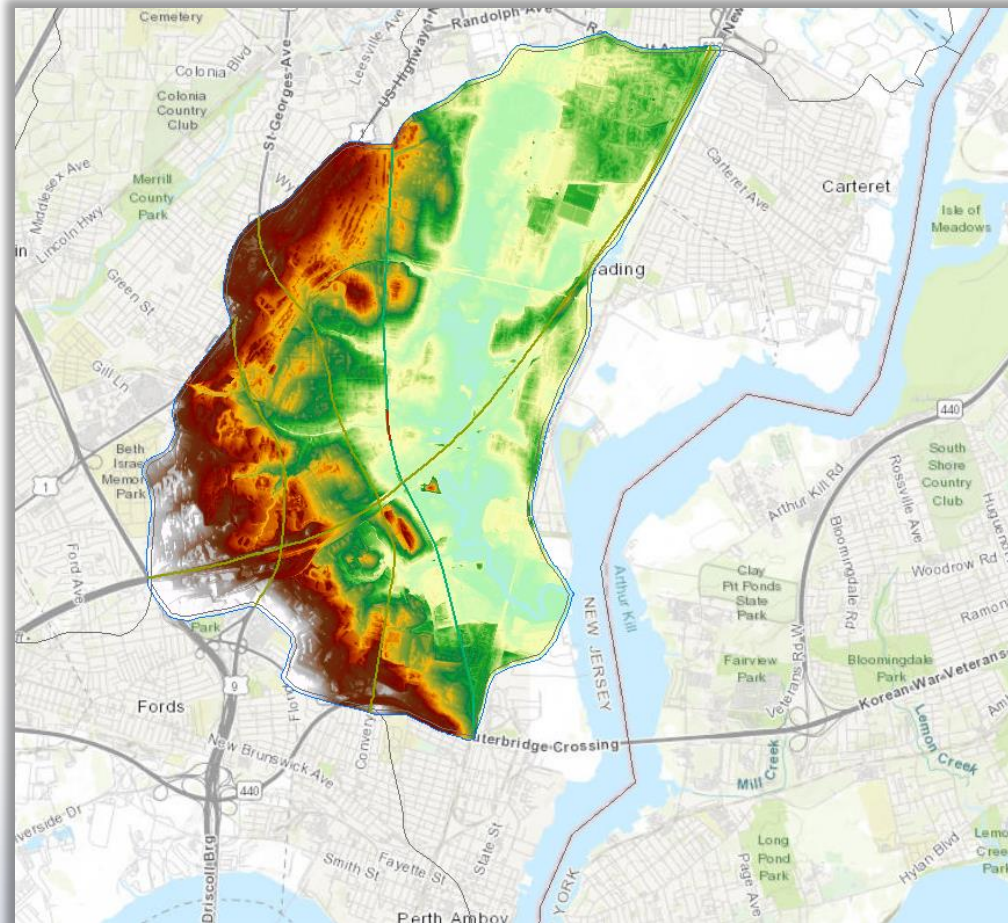

Potential Refinements

- **Smaller cell size in select areas**
 - Developed areas
 - Complex flow paths
 - Steeper terrain
- **Breaklines**
 - Roads
 - Railroads
 - Bridges
 - Streams
- **Structure openings**
 - Approximated with modifications to the mesh and/or terrain.
- Spatially varied precipitation
- Storm sewer representation
